

SUPERFICIAL X-RAY THERAPY SYSTEMS

THERAD

THERAD therapy systems include a series of X-ray therapy units in both the superficial and orthovoltage ranges. They have been designed to give clinical practitioners full flexibility to select the energy range that best suits their clinical needs and practice including options for customization.

THERAD systems allow high precision in dose delivery with real time monitoring. A set of standard coded and interlocked applicators is provided with the systems allowing the dose delivery only with the correct applicator attached. Non-standard customised applicators can be also developed upon customer request according to their specific needs.

Control software includes connectivity to patient management systems for import and verification of the patient data and treatment plan parameters, as well as export of the treatment performed data.
